

MK1 ULTIMATE FIGHTING RIFLE

BY SONS OF LIBERTY GUN WORKS

US SOCOM TESTED & SELECTED

MK1 ULTIMATE FIGHTING RIFLE

Developed, tested, and built to meet the demands of military special operations, the MK1 is engineered for serious, hard use in the harshest conditions. It represents the culmination of years of meticulous attention to detail and development—ensuring that every component serves a purpose. Whether in the hands of an armed professional or a prepared citizen, the MK1 enables peak performance when it matters most.

LIBERTY CHARGING HANDLE
The SOLGW Liberty Charging Handle is an ambidextrous offering allowing easy cycling from either shoulder. The MK1 is equipped with no-snag, narrow length charging handle.

ENHANCED UPPER RECEIVER

The upper receiver of the MK1 has a lowered forward extension to make it easier for lefties to cycle the charging handle. Also, protective fencing has been added around the enlarged, maritime bolt catch.

UNINTERRUPTED RAIL
The MK1 has an uninterrupted top rail to allow maximum mounting flexibility for optics, lights, lasers and other accessories. The front of the rail and rear of the receiver have also been contoured/cut to squeeze out the utmost in rail length.

THREE FORMS OF LOCKUP
With a large, titanium barrel nut incorporating the Drive-Lock system, as well as a dovetailed upper receiver and two additional stainless-steel pins holding everything in place, the MK1 rail has no equal for rigidity. The rail lockup has been tested to have minimal to no POI shift with lasers and optics.

MK1 CABLE MANAGEMENT RAIL

With a built-in deep cable management channel, profiled rail slots, and laser etched, hexagonal texturing, the MK1 Rail is a signature feature to the MK1 rifle. Cables may be routed through the channel to prevent snagging and excessive use of zip-ties. All of the rail slots have been chamfered and relief cut to minimize damage to cables. The cable management channel runs from the front of the handguard to the rear of the upper receiver, maximizing flexibility.

MK1 Cerakote Pattern - 11.5" SBR

INTERMEDIATE BUFFER SYSTEM
All MK1s feature an intermediate buffer system. In exchange for a slightly longer buffer tube, the rifle operates with a rifle spring and extended buffer, which lengthens the recoil cycle. This reduces bolt speed, smooths the recoil impulse, and improves reliability across a wider range of ammunition, conditions and when using a suppressor.

INTEGRATED QD ENDPLATE
The low-profile Integrated QD Endplate allows for easy sling attachment.

BADGER AMBI-SAFETY
The ambidextrous safety by Badger provides a positive feel and is drop-safe to military standards.

LIBERTY 2-STAGE TRIGGER
With a 2.5lb 1st-stage and 2lb 2nd-stage, the L2S trigger has a clean and precise break, along with a crisp reset. The trigger bow is a hybrid straight center section with curved upper/lower sections. The L2S helps deliver fast and accurate shots on target.

BUILT TO BE COOL
The MK1 was designed to operate in a high-round count training or operational environment. With a vented, titanium barrel nut coated in a space-age, heat-shedding coating, the MK1 takes longer to heat up and is faster to cool down.

PREMIUM BARRELS
Our barrels have been proven to be some of the most precise on the market. With P3 - polygonal 3-groove technology, the MK1 is regularly capable of 1 MOA or less with match ammunition, and shows excellent performance with bonded, solid copper, and frangible ammunition as well. The P3 rifling also provides for a longer service life and is easier to clean. Available in 11.5", 14.5", and 16" lengths.

LASER ENGRAVED, TEXTURED M-LOK HANDGUARD
Perhaps the most identifiable feature of the MK1 is the laser engraved texture on the handguard. Designed to provide a gripping texture without abrading equipment, a positive and sure grip is possible in any weather condition. By also having texture built-in, rail covers are not needed to also allow maximum airflow for better heat dissipation.

5/8x24 MUZZLE THREADS
Muzzle threads are 5/8x24, which SOLGW pioneered to market to offer greater precision and strength, even with extended strings of fire when suppressed. MK1 rifles ship standard with a flash hider from HUXWRX, compatible with Flow 556K and 6K suppressors.

ENHANCED LOWER RECEIVER
Our MK1 lower receiver is full of subtle details, from an integrated and enlarged trigger guard, to a flared magwell for fast reloads. The lower also has enlarged fencing to prevent accidentally releasing the magazine. With a precision fit to the upper receiver, the MK1 locks up like a bank vault.

MARITIME & MACHINE GUNS
The MK1 family of rifles is offered with a variety of application specific variants. For those working in maritime environments, a suite of specialty coatings and materials is available to provide the utmost in corrosion resistance. For users needing select-fire models, the MK1 is available with multiple trigger options.

FINISH FOR ANY FLAVOR
The MK1 is available in a variety of finishes, including black, gray, OD Green and FDE anodizing; as well as Cerakote single colors and the MK1 signature pattern.

Black Anodize - 11.5" SBR

Gray Anodize - 11.5" SBR

OD Green Anodize - 11.5" Pistol

Flat Dark Earth (FDE) Anodize - 14.5" Rifle

Sons of Liberty Gun Works Awarded U.S. SOCOM Contract for MK1 Rifle

SOLGW was awarded a contract by U.S. Special Operations Command (SOCOM) for the Combat Assault Rifle (CAR) program. Following a rigorous competitive evaluation, a select-fire variant of the SOLGW MK1 rifle with an 11.5-inch barrel was chosen to equip America's most elite warfighters.

SOCOM's evaluation demanded the highest standards of small arms performance, including extensive trials for durability, precision, reliability, and environmental resilience. The SOLGW rifle endured extreme conditions—heat, cold, dust, mud, and salt exposure—while maintaining consistent function and accuracy.

The MK1 selected by SOCOM is the result of a multi-year development effort, building upon SOLGW's extensive experience producing ultra-reliable rifles trusted by law enforcement and civilian shooters. Every component was analyzed and refined to maximize reliability, shootability, and durability, ensuring the platform can perform anywhere in the world.
